Web Automation for Testing, Time-Saving, and Profit

By Michael Mintz

About Me

- *I like to automate things.
- *I've built automation for HubSpot, Jana, Veracode, and others.
- *I've automated testing, website migrations, customer support, data extraction, and manual labor.

What is Selenium?

- *Browser automation framework for testing web applications
- *The latest iteration is called "WebDriver" (aka Selenium 2.0)

Why have browser automation?

- *Unit tests have limited coverage.
- *Web browsers can display the same data differently.

Common issues with automation

- *Can be slow
- *Flakey and unreliable
- *Tricky to write/maintain scripts
- *Tricky to read others' scripts
- *Time-consuming setup, etc.

Issue: Can be slow

*time.sleep() wastes time (developers use that often)

Issue: Can be flakey

*Unexpected behavior when interacting with page objects that haven't finished loading.

Issue: Tricky to read/write scripts

*Long lines of code are common:

driver.find_element_by_css_selector("textarea").send_keys("text")

*This is better:

self.update_text("textarea", "text")

Issue: Time-consuming setup

- *Takes extra time to add code for:
 - * Writing to a database
 - * Saving screenshots & data automatically on failures
 - * Etc...

Improving on Selenium

*SeleniumBase

An open-source Python framework that makes it easier to write reliable browser automation for testing and more...

http://seleniumbase.com

SeleniumBase

- *Easy Setup (takes < 3 minutes)
- * Reliable
- *Lots of functionality
- *Easy to write scripts quickly
- *Built on top of Selenium / WebDriver

Easy Setup

- *> pip install seleniumbase
- *Download web browsers (plus drivers) that you want to run automation on.

Try an example test

- *> git clone https://github.com/
 seleniumbase/SeleniumBase.git
- *> cd SeleniumBase/examples
- *> nosetests my_first_test.py --with-selenium

(Have Chrome and ChromeDriver installed)

Reliable methods

- *Methods wait for page objects to load before acting on them.
- *click()
- *update_text()
- *Etc...

Built-in Functionality

- *MySQL DB integration
- *S3 uploading
- *SeleniumGrid
- *Scanning emails
- *Headless browsers
- *Screenshots

Command-line control

- *Browser selection
- *Log path selection
- *Automation speed selection
- *MySQL option
- *S3 logging option
- *And more...

Configurable

- *Set timeout lengths
- *Set MySQL DB to connect to
- *Set S3 bucket to upload log files to
- *And more...

How to Configure

*Make changes to "settings.py"

(located in SeleniumBase/seleniumbase/config/)

*> python setup.py install

(That deploys your changes)

Sample script (easy to write)

```
my_first_test.py
      my_first_test.py
     from seleniumbase import BaseCase
3
4
    class MyTestClass(BaseCase):
6
        def test basic(self):
             self.open('http://xkcd.com/353/')
                                                                     # Opens the url
8
             self.assert_element('img[alt="Python"]')
                                                           # Asserts element on page
9
             self.click('a[rel="license"]')
                                                            # Clicks element on page
             xkcd_license = self.get_text('center')
                                                       # Gets text from page element
10
             assert('reuse any of my drawings' in xkcd_license)
11
12
             self.open('http://xkcd.com/1481/')
13
             image_object = self.find_element('#comic img') # Returns the element
             caption = image_object.get_attribute('title') # Gets attr from element
14
15
             assert('connections to the server' in caption)
             self.click_link_text('Blag') # Clicks link containing the text
16
17
             self.assert_text('The blag', 'header h2')  # Asserts text in element
             self.update_text('input#s', 'Robots!\n') # Updates textfield with text
18
19
             self.assert_text('Hooray robots!', '#content')
             self.open('http://xkcd.com/1319/')
20
```

self.assert_text('Automation', 'div#ctitle')

Written in Python

*If you know Python, you can write automation with SeleniumBase.

Built on Selenium / WebDriver

*You can run any WebDriver method you want by typing:

self.driver.{WEBDRIVER_METHOD}

Runs in multiple environments

- *OS X
- *Windows
- *Linux
- *Docker

SeleniumBase Docker example

```
Installed /usr/local/lib/python2.7/dist-packages/seleniumbase-1.1.23-py2.7.egg
Processing dependencies for seleniumbase==1.1.23
